DataKnots: A Framework for Building Domain Specific Query Languages

S02: Systems Demonstrations - Bringing it all together: The best of data integration

Clark C. Evans

The Mechanical Rabbit Collaboration

Twitter: @clarkevans

#IS21

Disclosure

I disclose the following relevant relationship with commercial interests:

- previously, technical co-founder of Prometheus Research, an IQVIA business

Learning Objectives

After participating in this session the learner should be better able to:

- understand how Query Combinators provides formal semantics for query tools, encapsulating technical detail with a vocabulary relevant to the physician scientist;

- see how DataKnots.jl, lowers cost barrier to constructing query systems;

- learn of challenges and possible solutions when using domain specific query languages (DSQLs) for integration of data; and

- consider database queries as a formal notation for research inquiries, enabling multidisciplinary team collaboration.

Research Collaboration Workflow

Diagram from "A centralized research data repository enhances retrospective outcomes research capacity: A case report", William Hruby, et all. JAMIA 2013

Domain Specific Query Languages (DSQL)

```
library CervicalCancerScreening version '7.2.000'
using QDM version '5.3'
include MATGlobalCommonFunctions version '2.0.000' called Global
⋮
valueset "Pap Test": 'urn:oid:2.16.840.1.113883.3.464.1003.108.12.1017'
⋮
define "Pap Test with Results":
  ["Laboratory Test, Performed": "Pap Test"] PapTest
   where PapTest.result is not null
⋮
define "PapTest Within 5 Years":
  ("Pap Test with Results" PapTestOver30YearsOld
     with ["Patient Characteristic Birthdate"] BirthDate
       such that Global."CalendarAgeInYearsAt"(
                   BirthDate.birthDatetime,
                   start of PapTestOver30YearsOld.relevantPeriod)>= 30
         and PapTestOver30YearsOld.relevantPeriod 5 years
           or less before end of "Measurement Period"
         )
```

queries facilitate
knowledge sharing

Clinical Quality Language (CQL) Fragment
for CMS 124v7 : Cervical Cancer Screening
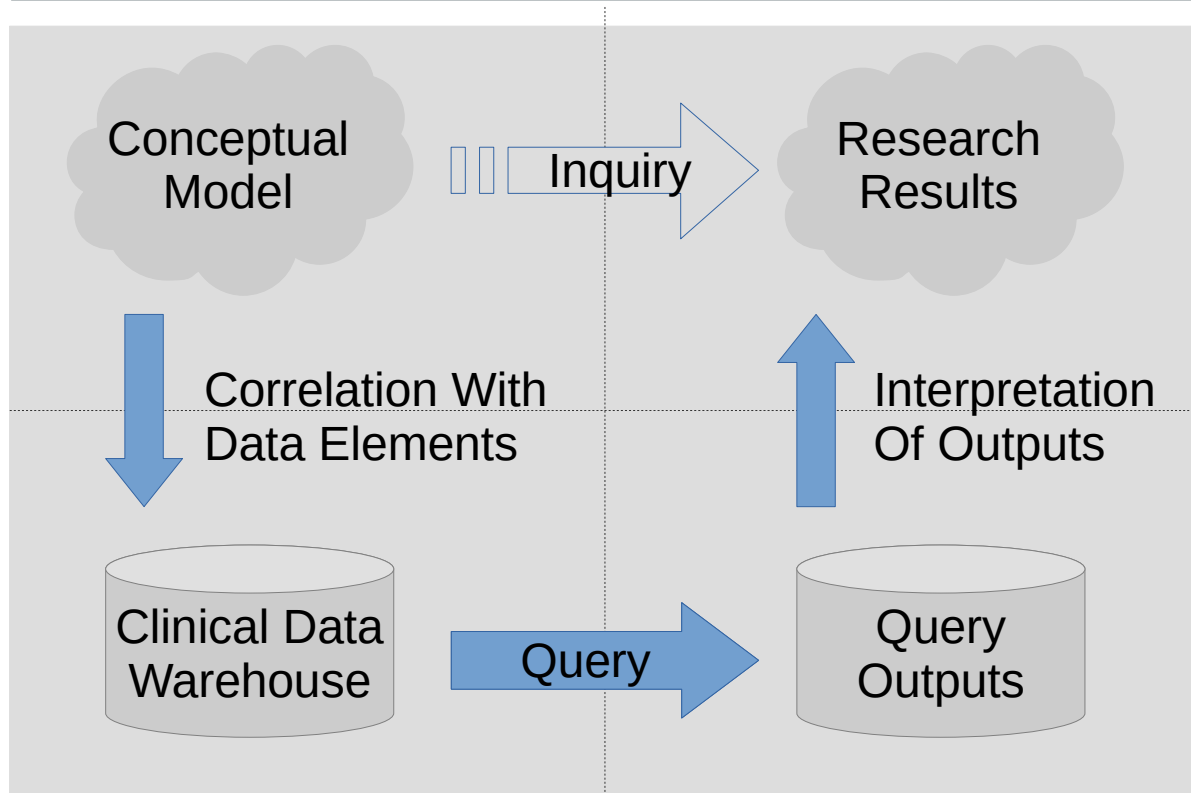

Query Anatomy : Data Model & Operations

```
library CervicalCancerScreening version '7.2.000'
using QDM version '5.3'
include MATGlobalCommonFunctions version '2.0.000' called Global
⋮
valueset "Pap Test": 'urn:oid:2.16.840.1.113883.3.464.1003.108.12.1017'
⋮
define "Pap Test with Results":
  ["Laboratory Test, Performed": "Pap Test"] PapTest
   where PapTest.result is not null
⋮
define "PapTest Within 5 Years":
  ("Pap Test with Results" PapTestOver30YearsOld
    with ["Patient Characteristic Birthdate"] BirthDate
      such that Global."CalendarAgeInYearsAt"(
                BirthDate.birthDatetime,
                start of PapTestOver30YearsOld.relevantPeriod)>= 30
        and PapTestOver30YearsOld.relevantPeriod 5 years
          or less before end of "Measurement Period"
        )
```

vocabulary & logic accessible to domain experts

Conceptual Inquiry and Executable Query

Conceptual Model

Inquiry → Research Results

Correlation With Data Elements

Interpretation Of Outputs

Clinical Data Warehouse

Query → Query Outputs

For collaborations, queries should describe the inquiry

DataKnots.jl : A Framework for DSQLs

- *Tight Relationship Between Conceptual Inquiries & Executable Queries*

- Vocabulary and Operations can be Tailored to a Domain

- Query Modules can be Mixed to meet Research Needs

- Shared Logic, Syntax, & Tooling

- Usable By Entire Research Team

DataKnots Prototype: Quality Measures

> vocabulary & logic accessible to domain experts

```
module CMS124
using DataKnots
using DataKnots4FHIR # for data model and extensions
⋮
@valueset PapTest = "2.16.840.1.113883.3.464.1003.108.12.1017"
⋮
@define PapTestWithResults =
        LaboratoryTestPerformed.
          filter(code.matches(PapTest) && exists(value))

⋮
@define PapTestWithin5Years =
        let birthDate => PatientCharacteristicBirthdate.birthDateTime,
          previous5years => MeasurePeriod.end.and_previous(5years)
        PapTestWithResults.
        filter(years_between(relevantPeriod.start, birthDate) >= 30 &&
               relevantPeriod.during(previous5years))
        end
⋮
end
```

Query Primitives

Tabular Model

Patient

| identifier | PK | Integer |
| birthdate | NN | Date |

PK Primary Key
FK Foreign Key
NN Not Null

Condition

patient_id	FK	Integer
category	NN	Text
onset	NN	Date
abatement		Date

Functional Model

Database

patient

Patient — condition — Condition

birthdate

onset

identifier

abatement

category

Integer   Date   Text

Hierarchical Model

patient — identifier
          birthdate
          condition — category
                      onset
                      abatement
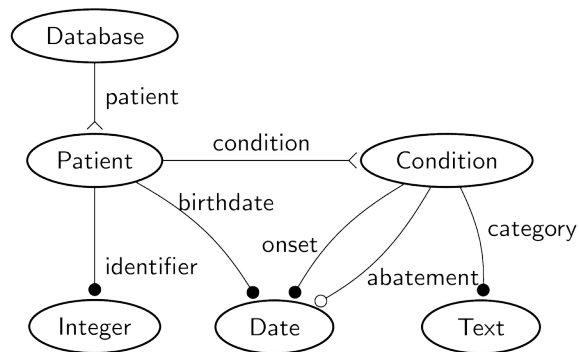

Primitive Queries

Primitive	Signature
patient	Database $\rightarrow$ Patient*
identifier	Patient $\rightarrow$ Integer
birthdate	Patient $\rightarrow$ Date
condition	Patient $\rightarrow$ Condition*
category	Condition $\rightarrow$ Text
onset	Condition $\rightarrow$ Date
abatement	Condition $\rightarrow$ Date$^?$

Query Combinators

Count Combinator

$$\frac{f \qquad A \to B^*}{\mathsf{count}(f) \qquad A \to \mathsf{Integer}}$$

count() applied to patient

$$\frac{\mathsf{patient} \qquad \mathsf{Database} \to \mathsf{Patient}^*}{\mathsf{count(patient)} \qquad \mathsf{Database} \to \mathsf{Integer}}$$

Composition Combinator

$$\frac{\begin{matrix} f & A \to B^* \\ g & B \to C^* \end{matrix}}{f \text{.} g \qquad A \to C^*}$$

Composition of patient and condition

$$\frac{\begin{matrix} \mathsf{patient} & \mathsf{Database} \to \mathsf{Patient}^* \\ \mathsf{condition} & \mathsf{Patient} \to \mathsf{Condition}^* \end{matrix}}{\mathsf{patient.condition} \qquad \mathsf{Database} \to \mathsf{Condition}^*}$$

Encapsulate Technical Query Details

How many patients, 18 or older, have an active diagnosis of Essential Hypertension?

Adults With Hypertension

patient

filter   (age $>= 18$ &&

has_active_diagnosis(

essential_hypertension))

count()

Domain Definitions

essential_hypertension = "59621000"

age = years(now() − birthdate)

has_active_diagnosis(x) =

exists(condition.filter(

category $== x$ &&

is_null(abatement)))

Query Fragment, Revisited

```
module CMS124
using DataKnots
using DataKnots4FHIR # for data model and extensions
⋮
@valueset PapTest = "2.16.840.1.113883.3.464.1003.108.12.1017"
⋮
@define PapTestWithResults =
        LaboratoryTestPerformed.
            filter(code.matches(PapTest) && exists(value))

⋮
@define PapTestWithin5Years =
        let birthDate => PatientCharacteristicBirthdate.birthDateTime,
            previous5years => MeasurePeriod.end.and_previous(5years)
            PapTestWithResults.
            filter(years_between(relevantPeriod.start, birthDate) >= 30 &&
                    relevantPeriod.during(previous5years))
        end
⋮
end
```

Combinator	Definition
matches	Valueset matching on a domain.
and_previous	Extends a time interval to the left.
years_between	Compares years between dates
during	If an interval (or date) occurs within another

https://github.com/rbt-lang/DataKnots4FHIR.jl/blob/master/doc/src/cms124v7.jl

Julia Syntax (expanding @define macro)

```
@define PapTestWithin5Years =
        let birthDate => PatientCharacteristicBirthdate.birthDateTime,
            previous5years => MeasurePeriod.end.and_previous(5years)
          PapTestWithResults.
          filter(years_between(relevantPeriod.start, birthDate) >= 30 &&
                 relevantPeriod.during(previous5years))
        end
```

Julia w/o macro
is identical,
only different syntax

```
Given(:birthDate => It.PatientCharacteristicBirthdate >> It.birthDateTime,
      :previous5Years => and_previous.(It.MeasurePeriod >> It.end, 5years,
    PapTestWithResults >>
    Filter(years_between.(It.relevantPeriod >> It.start, It.birthDate) >=. 30 &&.
             during.(It.relevantPeriod, It.previous5years))) >>
Label(:PapTestWithin5Years)
```

The Quality Data Model Layer

The **years_between** combinator is a Julia function lifted to queries:

```
years_between(lhs::Date, rhs::Date) =
    year(lhs) - year(rhs) -
     (month(lhs) > month(rhs) ? 0 :
     (month(lhs) < month(rhs) ? 1 :
     (day(lhs) >= day(rhs) ? 0 : 1)))
```

Further, **PatientCharacteristicBirthdate** is just a regular Query object

```
QDM_PatientCharacteristicBirthdate =
    #TODO: use patient-birthTime extension if possible
    It.entry.resource >>
    FHIRProfile(:STU3, "Patient") >> Is1to1 >>
    Record(
     :code => Set{Coding}([Coding(:LOINC, Symbol("21112-8"))]),
     :birthDateTime => DateTime.(It.birthDate) >> Is1to1
    ) >> Label(:PatientCharacteristicBirthdate)
```

The QDM layer is lifted functions and simple queries

https://github.com/rbt-lang/DataKnots4FHIR.jl/blob/master/src/quality.jl#L30

The FHIR Profile Layer

First, we unpack the profiles by reading FHIR Profile JSON…

```
    UnpackProfile =
      Record(
        It.id >> IsString,
        :kind => Symbol.(It.kind >> IsString),
        :elements =>
          It.snapshot >> IsDict >>
          It.element >> IsVector >> IsDict >>
          Filter((It.max >> IsString) .!= "0") >>
        Record(…) >> Drop(1))
```

Then, FHIRProfile(:STU3, "Patient") dynamically constructs a query.

```
    function FHIRProfile(standard::Symbol, profile)
        …
        return IsDict >> resourceFilter >>
            build_profile(…) >> Label(ident)
      end
```

The FHIR layer is Julia that builds queries via profile

https://github.com/rbt-lang/DataKnots4FHIR.jl/blob/master/src/profile.jl#L54

```
define "PapTest Within 5 Years":
  ("Pap Test with Results" PapTestOver30YearsOld
    with ["Patient Characteristic Birthdate"] BirthDate
      such that Global."CalendarAgeInYearsAt"(
                BirthDate.birthDatetime,
                start of PapTestOver30YearsOld.relevantPeriod)>= 30
      and PapTestOver30YearsOld.relevantPeriod 5 years
        or less before end of "Measurement Period"
      )
```

> DataKnots is comparable but also generalizable

```
@define PapTestWithin5Years =
        let birthDate => PatientCharacteristicBirthdate.birthDateTime,
            previous5years => MeasurePeriod.end.and_previous(5years)
          PapTestWithResults.
          filter(years_between(relevantPeriod.start, birthDate) >= 30 &&
                  relevantPeriod.during(previous5years))
        end
```

SQL Alternative for OHDSI Cohort Queries

Occurrences of an angioedmia
diagnosis during an impatient or
emergency room visit
(from The Book of OHDSI, chapter 9: SQL and R)

```
person
keep(erip_visit => visit.filter(
    concept.iscoded("Visit",
                    "ERIP", "ER", "IP"))
condition
keep(index_date => start_date)
filter(concept.iscoded("SNOMED", 41291007))
filter(erip_visit.includes(index_date))
{ subject_id => person.person_id,
  cohort_start_date => start_date,
  cohort_end_date => end_date }
```

```
SELECT cohort_start_date, cohort_end_date, subject_id
FROM (
  SELECT DISTINCT person_id AS subject_id,
    condition_start_date AS cohort_start_date,
    condition_end_date AS cohort_end_date
  FROM @cdm_db_schema.condition_occurrence
  INNER JOIN concept_ancestor
    ON condition_concept_id = descendant_concept_id
  WHERE ancestor_concept_id = 432791
) distinct_occurrence
INNER JOIN schema.visit_occurrence
  ON subject_id = person_id
  AND visit_start_date <= cohort_start_date
  AND visit_end_date >= cohort_start_date
WHERE visit_concept_id IN (262, 9203, 9201);
```

https://github.com/rbt-lang/SynPUF-HCFU/blob/master/cohorts/1770674.md

Implementation Notes & Performance

- Given `JSON.jl` and `DataKnots.jl`, implementation took 27 days
- Maintainable encapsulation of logic at FHIR, QDM, and eCQM layers
- Computation of CMS124v7 over 1,000 patients averages 76ms per patient with a single core on a i7-4770 desktop computer
- Computation of same measure using Database Consulting Group, CQL Measure Processing Component (https://github.com/DBCG/cqf-ruler) on same computer averaged 607ms per patient
- Our bottleneck is memory usage, with a high-water mark of 11mb per patient. JSON parsing is expensive (17ms/patient).
- Julia has a "slow start" – every unique query is compiled, not interpreted

https://github.com/rbt-lang/DataKnots4FHIR.jl/blob/master/test/benchmark.jl
